

ABSTRACT OF THE DISCLOSURE

A plant protector securing device includes a flexible panel that has a
5 top side, a bottom side, and a peripheral edge. Each of a plurality of
elongate members has an attached end attached to the peripheral edge and
a free end extending away from the panel. Each of a plurality of spikes is
attached to one of the free ends of the elongate members. The bottom side
of the panel may be abutted against an upper side of a rose protective
10 covering and the spikes driven into a ground surface such that the device
secures the protective covering to the ground surface.
